

Helion Bio

Reprogramming macrophages to clear solid tumors

Seed round | \$4M | San Diego, CA

The Problem

Checkpoint inhibitors fail in 80% of solid tumor patients.

Tumor-associated macrophages actively suppress T-cell response.

No approved therapy targets the macrophage compartment directly.

Our Solution

HLN-101 is a small molecule SIRP-alpha antagonist.

Repolarizes M2 macrophages to an M1 phenotype in vitro.

Oral dosing; no cold chain required.

Team

Dr. Marisol Reyes, CEO - 12 years at Genentech, led two INDs.

Dr. Peter Kwan, CSO - Professor of Immunology, UCSD.

Commercial lead role is currently open.

The Ask

Raising \$4M seed to complete IND-enabling toxicology.

18 month runway to a Phase 1 start.

No lead investor committed to date.
